# Paylet

Instant Solana micropayment rails so AI agents can pay each other in real time

## The Problem & Our Solution

AI agents need to pay each other for data, compute, and API calls, but today's rails are too slow and human-gated for sub-cent transactions.

- AI agents increasingly transact with each other, but existing rails need humans: cards, invoices, approvals.
- Sub-cent payments for API calls, data, and compute are impractical on slow, costly legacy rails.
- Paylet is a drop-in SDK and on-chain escrow program for instant agent-to-agent payments.
- Settles in USDC on Solana in sub-second time, with no human approval required.
- On-chain reputation scoring automatically throttles bad actors based on payment history.

# How It Works

Paylet lets agents pay per call or stream payments, settling instantly on-chain with wallets, escrow, and reputation scoring.

- HTTP 402-style middleware lets agents pay per call, settling on Solana in sub-second time.
- Embedded Privy wallets give each agent its own programmatically managed Solana wallet.
- Streaming payment channels let agents pay continuously for ongoing, usage-based billing.
- An Anchor program escrows USDC on-chain, releases payment, and updates reputation scores.
- A dashboard shows agent spend, earnings, and active payment streams for human oversight.

**Built with**

Solana, Anchor, Rust, TypeScript SDK, Privy embedded wallets, USDC, x402 protocol

# Why Now & What's Next

Autonomous agents are scaling fast and need machine-speed payment rails; Solana's speed and cost make this the right moment to build them.

- Autonomous AI agents are exploding, and they need to transact with each other today, not someday.
- Solana's sub-second finality and low fees uniquely fit sub-cent, high-frequency agent payments.
- Paylet builds early on the emerging x402 protocol for agent-native, HTTP-based payments.
- Next: integrate with agent frameworks like LangChain for faster adoption.
- Next: launch a marketplace of pay-per-call APIs, then add cross-chain settlement.
